Oil/water coolers

Combined coolers

FUTURE WITH A SYSTEM.

KTR have consistently continued to extend their expertise in building systems over the past few decades. Today we are a leading manufacturer providing solutions with highest quality standards in the fields of drive technology, brake and cooling systems as well as hydraulic components to our global business partners.

So what would be more obvious than adapting our company name to this development? KTR Kupplungstechnik GmbH has become KTR Systems GmbH.

The change of name takes account of the growing diversity of our performance range demonstrating the global markets and our customers that we are prepared to take over just more responsibility in machines and plants.

COOLING SYSTEMS BY KTR: ALWAYS AT THE PERFECT TEMPERATURE.

Wherever someone is working, heat is produced. And wherever KTR products are used, people are often working hard. That is why KTR has thought about heat dissipation. And has finally implemented the results of these thoughts - in

terms of high-performance and efficient cooling systems which are used both in mobile and stationary hydraulics.

**With our cooling systems
your plant will never take
a break from the heat
again.“**

Joachim Grunwald, Product Manager Cooling Systems

Cooling with a system – and with care

When the going gets hot, you must show a cool reaction. This is not only a wisdom for life, but also our design engineers' dictum which is mainly applied if the development of reliable cooling systems is concerned. No matter whether construction machines or hydraulic power packs, wind energy plants or elevator construction, rail technology or steel and iron industry are concerned: Wherever heavy-duty jobs have to be performed, heat has to be dissipated quickly and efficiently. This is the only way to preserve the performance capacity of the drive, extend its operating times and finally its service life.

In order to succeed in achieving a temperature compensation, we provide for highly efficient cooling systems for different media such as oil, air, coolants or fuel. And since a company having the slogan "Made for Motion" does not maintain the status quo, our design engineers continue to find new options to develop these systems.

Wind energy plants

One example is the new high-performance cooler MMC eco for wind energy plants. As signified by the suffix eco, it allows for particularly energy-efficient cooling: It generates only as much cooling air as necessary. This is done by acting very carefully. A sensor measures the temperature of the medium and transmits it to a control unit. This unit tells the fan how much it has to operate - or how little. This is a sophisticated way of communication improving the degree of efficiency of the wind energy plant and reducing the operating expenses. By the way, the compact design is just as sophisticated: The high-performance cooler MMC eco generates much wind in a tight space so that it can comfortably be installed in narrow nacelles.

OAC eco – intelligent cooling for hydraulic systems

Sometimes less is more - the same applies with hydraulics. With the new OAC eco KTR is the first supplier having launched a cooling system with infinitely variable speed control for stationary drives onto the market. Like with its „big brother“ MMC eco the control unit has everything under control and defines the cooling capacity as needed. In this way the service life of the cooling system is increased while the life cycle costs and noise emissions of the overall plant are reduced.

Anyway, the OAC eco has a lot more to offer: a self-cleaning mode. At the touch of a button the torsional direction of the fan changes during 60 seconds, while the air pressure which is generated simply wipes away dust and dirt. This is a top performance which will finally pay off by the efficiency of the machine.

Selection system

To select the suitable cooler you need to know the following details:

Q [kW]	Heat to be dissipated
V [l/min]	Oil flow
T_{oil} [°C]	Inlet temperature of oil into cooler
T_L [°C]	Inlet temperature of ambient air into cooler

Example of calculation

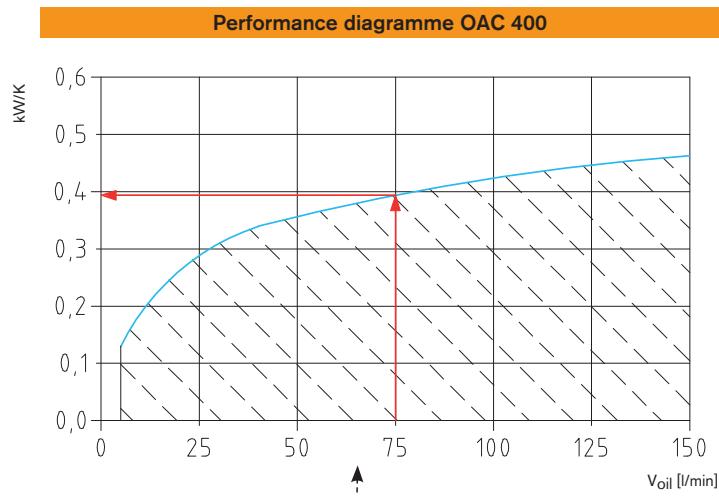

Details given:

$$Q = 12 \text{ kW}$$

$$V = 75 \text{ l/min}$$

$$T_{oil} = 65 \text{ °C}$$

$$T_L = 30 \text{ °C}$$

Calculation of specific cooling capacity

$$\text{Inlet temperature difference ETD [°C]} = T_{oil} - T_L$$

$$\text{Specific cooling capacity required } P_{req.} = Q/ETD$$

The specific cooling capacity required must fall below the performance curve! $\rightarrow 12 \text{ kW}/(65\text{°C} - 30\text{°C}) = 0.34 \text{ kW/°C}$

The following was selected: OAC 400

The actual cooling effect of the cooler is $0.39 \text{ kW/°C} \times 35\text{°C} = 13.65 \text{ kW}$

Calculation of pressure loss

The pressure loss in the curves of the different data sheets is based on a viscosity of 30 cSt

The effective pressure loss is calculated as follows:

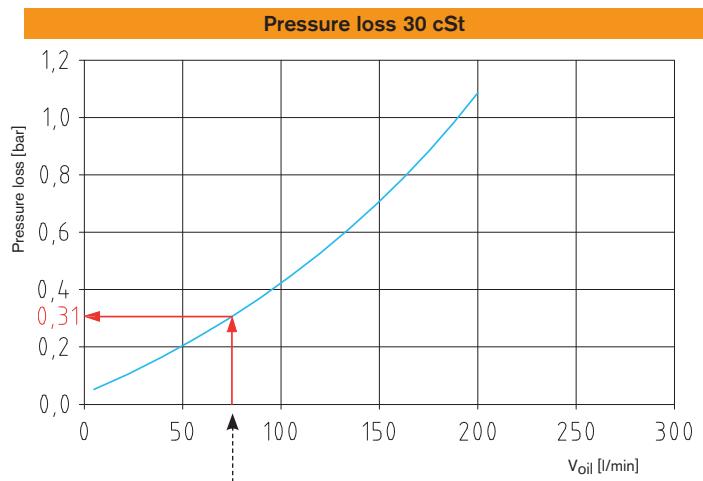

Pressure loss (from curve) x factor = effective pressure loss

Example

$$V_{oil}: 75 \text{ l/min}$$

$$\text{Viscosity: } 20 \text{ cSt}$$

$$\rightarrow 0.31 \text{ bar} \times 0.75 = 0.233 \text{ bar}$$

Oil/air cooler type OAC eco

Cooling systems

Reducing noise and saving energy

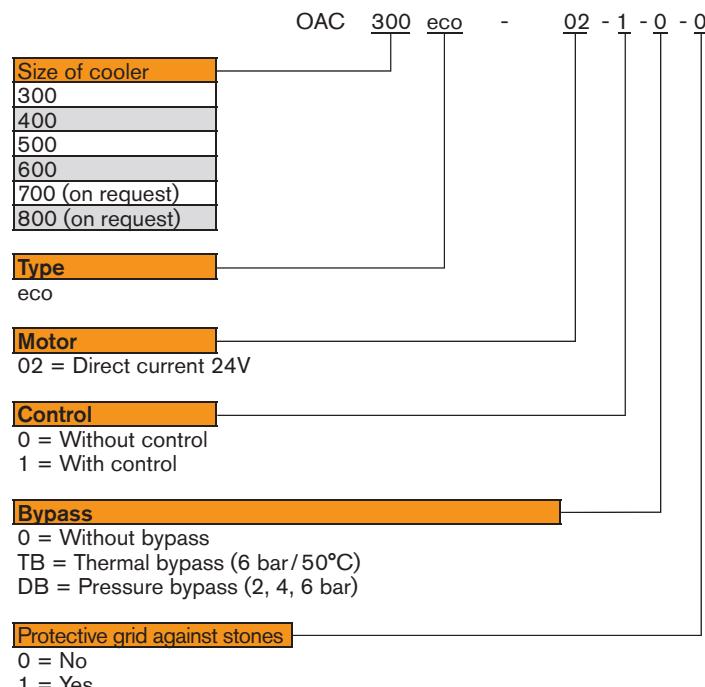

- Energy consumption optimised to requirements
- Variable speed fan motor
- Infinitely variable adaptation of cooling capacity oriented to requirements
- Operating voltage 24V
- Protective class IP65
- Up to 25 kW cooling capacity with ΔT : 40°K
- CE certification
- High-performance cooler core made of aluminium for a maximum static operating pressure of 10 bar
- Three temperature curves pre-set
- Cleaning operation & program change at the touch of a button during operation
- Oil inlet temperature is permanently displayed

Structure

- Cooler core made of aluminium
- Fan cover made of steel
- Fan made of nylon incl. protective grid
- Motor 24V, IP65
- Temperature Fan Speed Control (TFSC)
- Temperature sensor

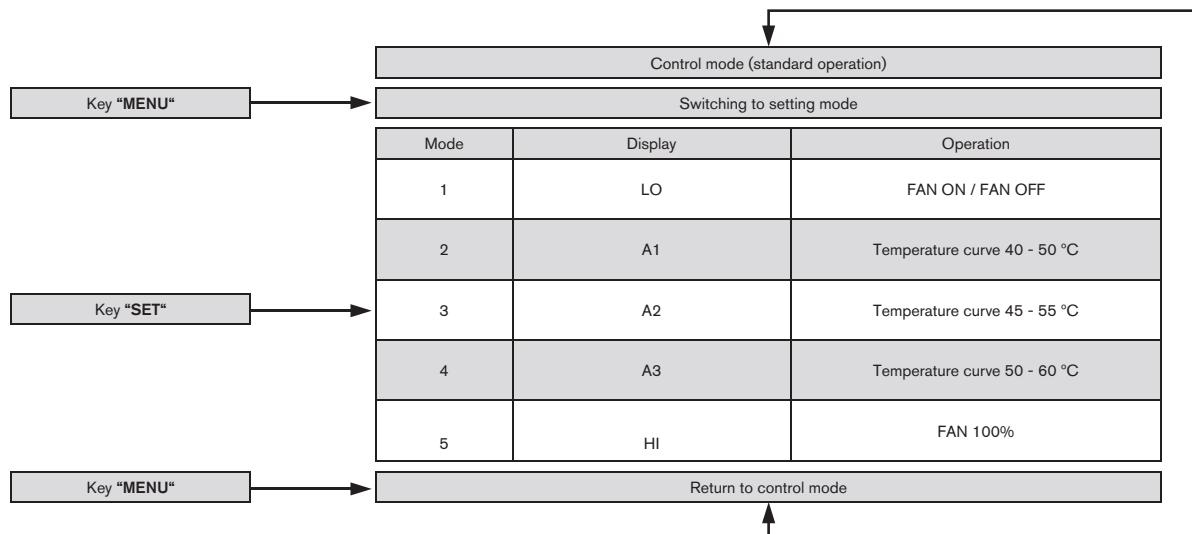

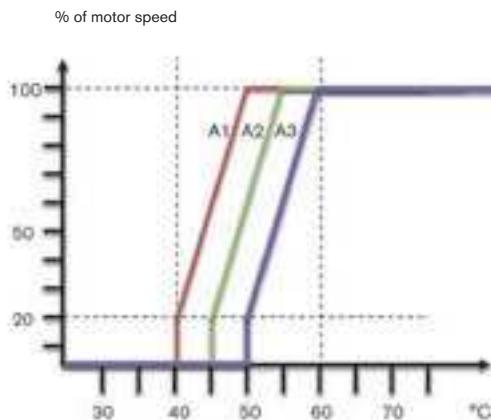

The OAC eco series is based on the previous standard, reduces noise which is generated and the energy consumption without accepting any loss in performance.

Type code

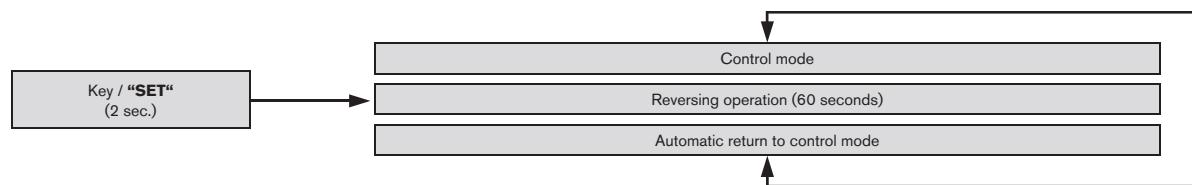

Operation

The control module TFSC is part of the cooler series eco controlling the speed of the motor. For that purpose the temperature value of the sensor is directly assigned to the motor speed. For various loads three temperature curves defined by the manufacturer are available (mode 2, 3, 4). In addition the fan can be permanently switched on or off, mode 1 and 5.

TSFC is operated via three buttons. The device is switched on or off via „ON/OFF“, while it is started in the control mode which is set as a standard by the manufacturer (mode 2). Via „MENU“ you can switch between control mode and setting mode (mode 1, 2, 3, 4, 5). With the control mode the current temperature of the sensor is displayed, with the setting mode the operating mode selected is displayed. The key „SET“ serves for changing the parameters 1-5.

Pressing the SET key may call the cleaning operation in addition. Here the fan rotates with full speed during 60 seconds in opposite direction. In the meantime the display counts back the remaining time in seconds. On completion the device restarts in the control mode. The cleaning operation can be interrupted by pressing the key „MENU“ at any time.

Oil/air coolers / cooling-pumping unit type OPC

Cooling systems

Type code of industrial coolers oil/air

Bypass, protective grid

Bypass operation for OAC & OPC coolers

Thermal pressure bypass

- The pressure relief valve opens with pressure peaks from 6 bar
- The bypass piping is closed from an oil temperature of 50 °C via thermocouple

Pressure bypass

- The pressure relief valve opens with pressure peaks from 6 bar

Protective grid for OAC & OPC coolers

Plain protective grid

- Wire mesh made of steel protecting against foreign particles

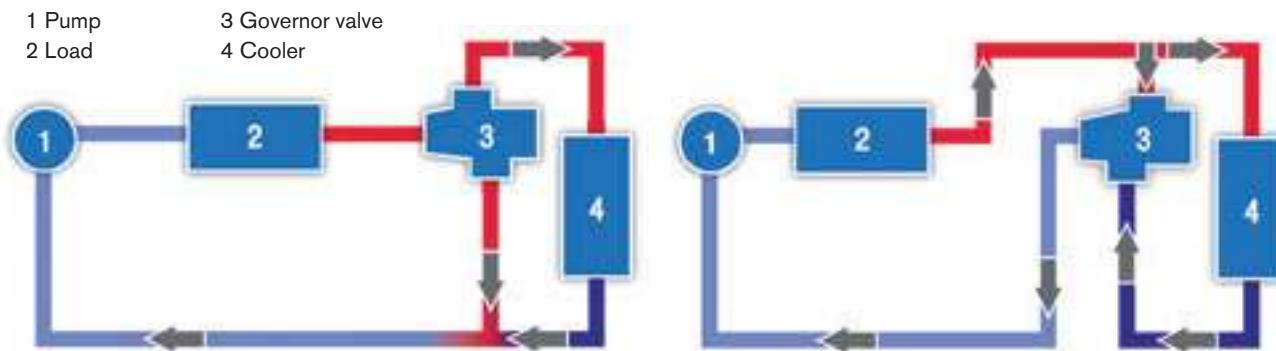

Protective grid with filter element

- The wire mesh is provided with a dust protection filter additionally

Oil/air coolers accessories

Cooling systems

Oil thermostat valve

Use as a short circuit control:
Constant temperature on load outlet

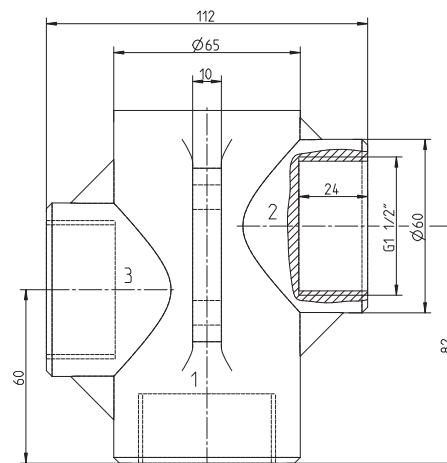

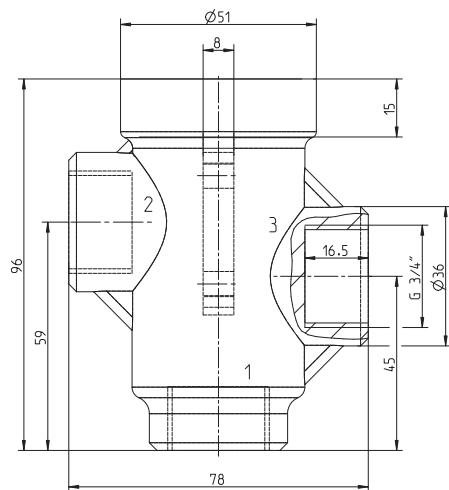

Use as a mixing valve:
Constant temperature on load inlet

Main applications of oil thermostat valves

- Agricultural machines
- Construction machines
- Compressors
- Coolers
- Special applications, e. g. wind power stations, gearboxes, hydraulics, general engineering

Particular characteristics

- Temperature figures set
- High control accuracy
- Control operation independent of static and dynamic oil pressure
- Low pressure loss
- Sound design
- Insensitive to vibrations
- Insensitive to shocks
- Operation independent of the mounting situation
- Maintenance-free
- Long service life

OTV Oil thermostat valve				
Description	Max. volume flow [m³/h]	Connection thread	Inlet temperature [°C]	Max. inflow to the cooler obtained with °C
OTV1-45	4	G 3/4"	45	60
OTV1-55	4	G 3/4"	55	70
OTV1-70	4	G 3/4"	70	85

OTV2-55	10	G 1 1/2"	55	70
OTV2-70	10	G 1 1/2"	70	85

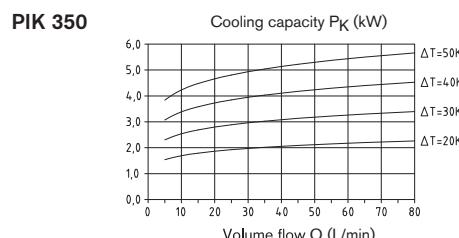

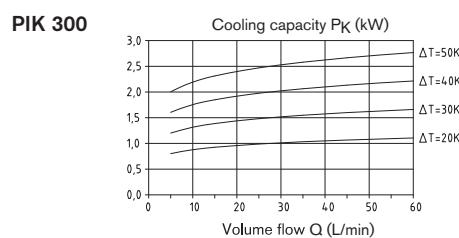

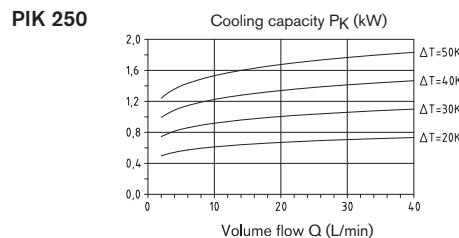

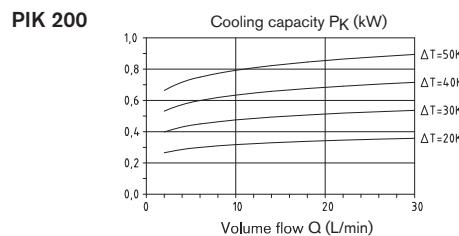

max. operating pressure 16 bar

Ordering example:	1	55
Oil thermostat valve	Size	Inlet temperature

Oil/air coolers type PIK Cooling systems

Oil/air cooler type PIK 200 - 350

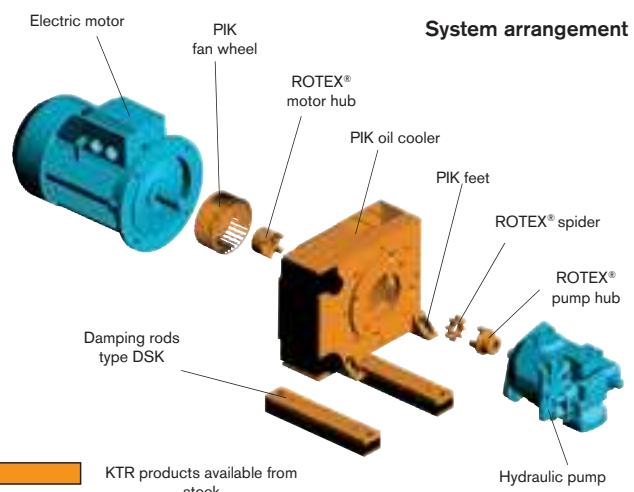

1. Cooling capacity for a speed of 1500 rpm depending on the temperature difference between oil intake and air intake and oil volume

The diagrammes shown are based on actual measurements of the PIK oil cooler performed in the KTR R & D test center. With 3000 rpm the cooling capacity is increased by approx. 50 %.

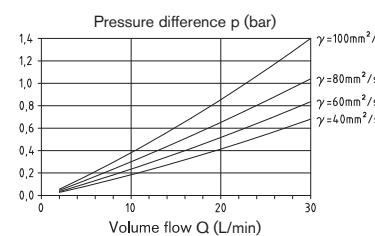

2. Operating pressure

The permissible operating pressure for the oil cooler is 12 bar with dynamic operation. Max. operating pressure with static load is 20 bar. (All figures apply for the medium pressure cooler.)

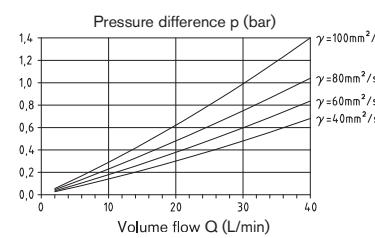

3. Pressure difference depending on oil flow and oil viscosity

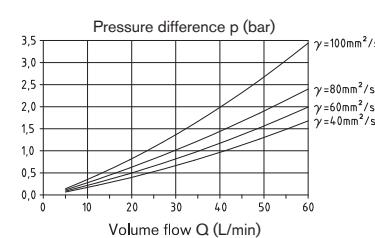

PIK 200

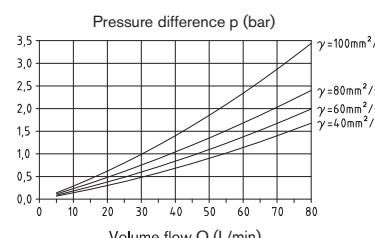

PIK 250

PIK 300

PIK 350

Viscosity measured up to 100 mm²/s.

Higher viscosity on request.

4. Fan wheel

Torsional direction view onto the pump – right – standard type.

Performance of the fan with 1500 rpm

PIK 200 = 25 W

PIK 250 = 40 W

PIK 300 = 125 W

PIK 350 = 230 W

Air pressure rate in m³/h with 1500 rpm

PIK 200 = ca. 90 m³/h

PIK 250 = ca. 200 m³/h

PIK 300 = ca. 400 m³/h

PIK 350 = ca. 860 m³/h

5. Cooler connection

R 3/4" internal thread

6. Oil flow

With higher flow rates than specified in the diagramme, please consult with us. Phone: +49 5971 798-0

Operating conditions for the above table:

Shell circuit: VG37 oil with an inlet temperature of 60 °C

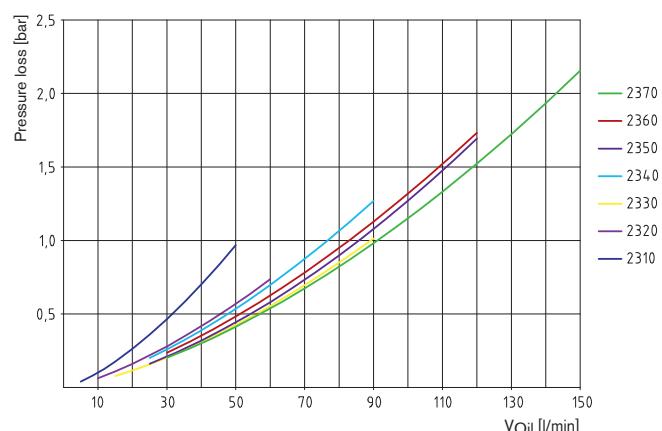

Tube circuit: Plain water with an inlet temperature of 20 °C

Please note: Different fluids have different thermal and mechanical properties. Fluids other than those indicated above will generate different performance characteristics to those shown in the table. For an accurate calculation of cooling performance please contact the KTR engineering team, phone: +49 5971 798-0 or www.ktr.com.

Summary of literature

No matter if a perfect drive, a brake that takes effect, space-saving cooling or accurate hydraulics is required, if on land, by sea or at an airy height - KTR's product portfolio is just as manifold as its applications. The following catalogues and leaflets provide for a survey. Available at www.ktr.com

Made for Motion The KTR logo features the letters "KTR" in a bold, orange, sans-serif font. The letters are partially enclosed within a stylized, orange hexagonal frame that has inward-pointing arrowheads at each corner, suggesting motion.
